

# OpenShift meets Vault – learn about cloud security with Adfinis

Increasing digitalization brings **new challenges**, especially when it comes to security. For companies handling **sensitive data** – such as banks, financial institutions, and insurance companies – it is a top priority to keep tight control over the assets that **protect** the very core of their business.

HashiCorp's Vault can be the central pillar to a solution that strongly mitigates the risk of breached secrets and stolen data. In a **one-hour free consulting session** about secrets management, certificates PKI, and Vault architecture in combination with OpenShift, Adfinis will discuss with you how you can keep **your secrets** safe in a cloud world.

During the session, we will first assess your current infrastructure and secrets management and then talk to you about the **benefits of using Vault**, from its secrets management capabilities and its data encryption procedure to its advanced **data protection**. We will show you the principles of how Vault works and go over how to best implement it in a **cluster running on OpenShift**, which in turn runs on **Microsoft Azure – a complete cloud platform** combining cloud services and enterprise-ready open source components. You will also learn about how Vault can handle your secrets in an auditable and compliant way.

At the end of the workshop, you will have time to ask our experts all your questions. The session can be held in **German or English**, is **non-binding** and will be conducted with our Solutions Engineers.

**Are you ready to learn more about secrets management using Vault on OpenShift?**
